

Doxy RUN → by Ishiyah Ahmed.

⇒ initially head = nullptr
tail = nullptr. (set in constructor).

① insertAtEnd (201).

As head is pointing nullptr so the end simply means the first node.

head →

Nullptr	201	Nullptr
---------	-----	---------

 ← Tail

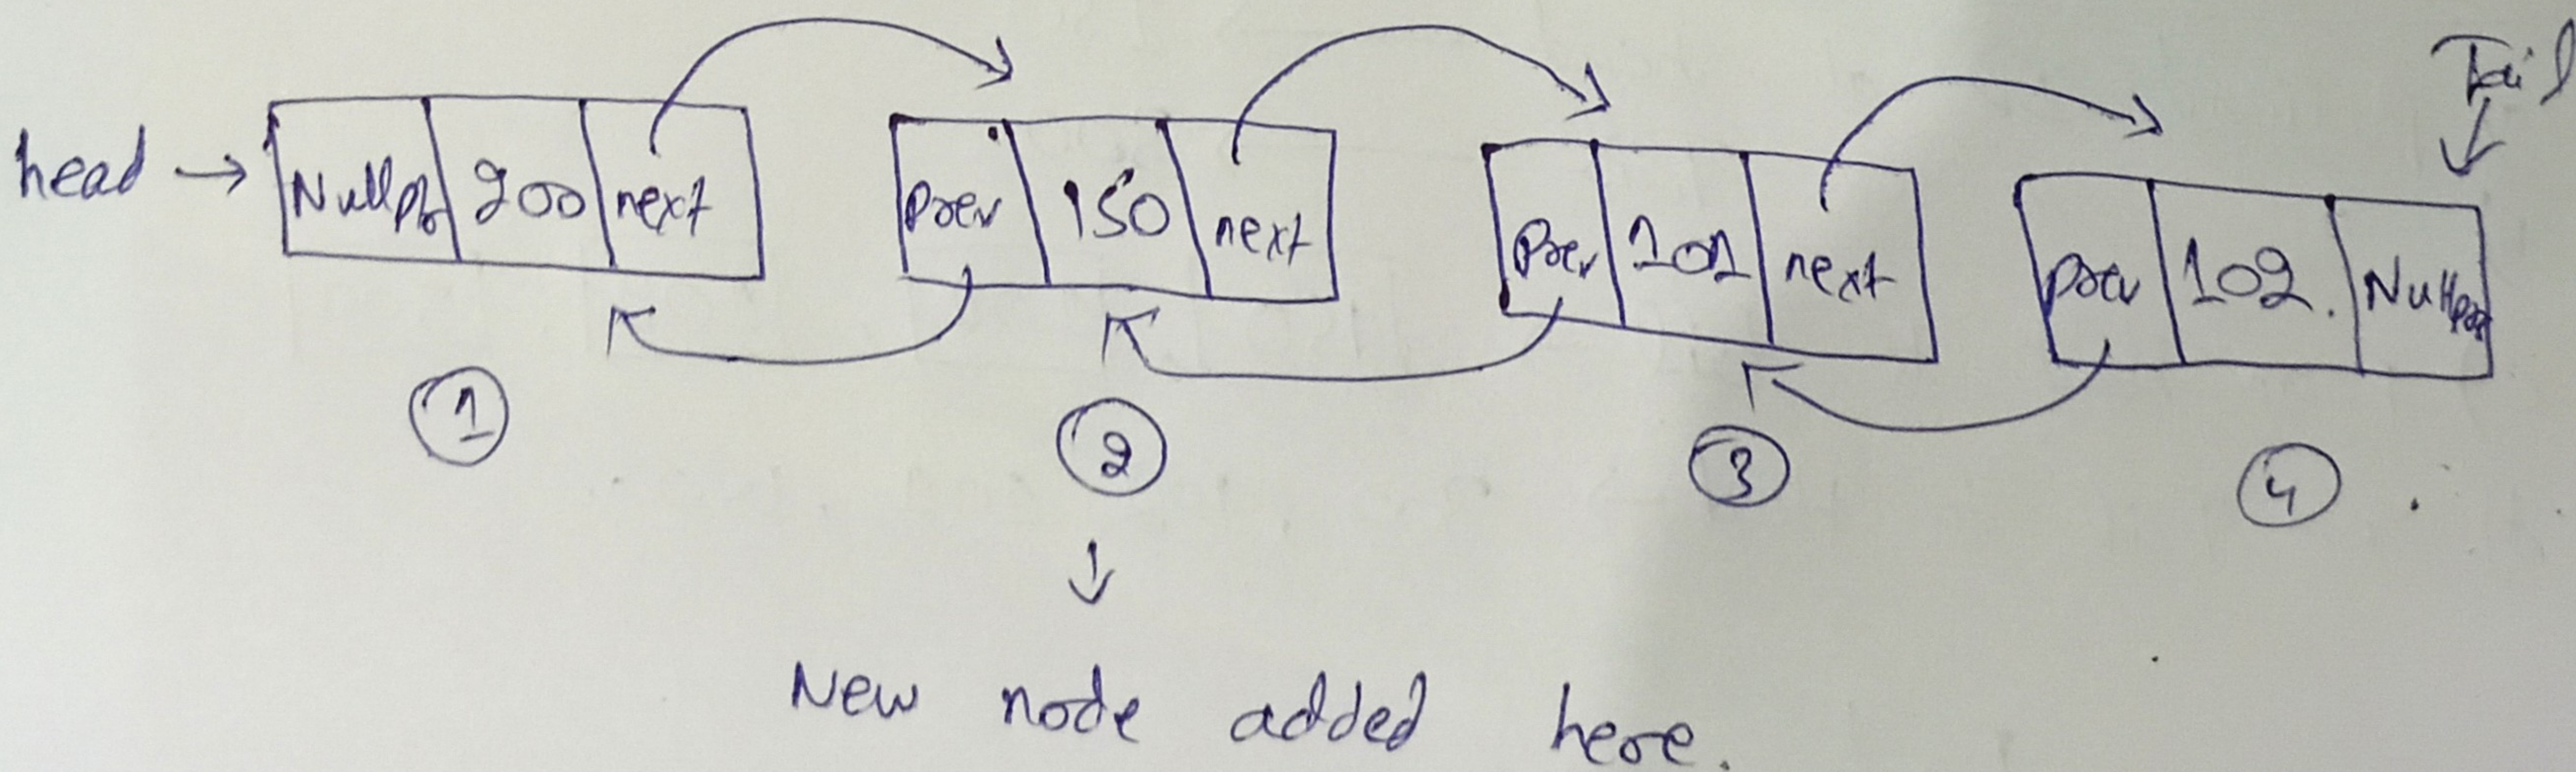

② insertAtEnd (202).

③ insertAtBeginning (200).

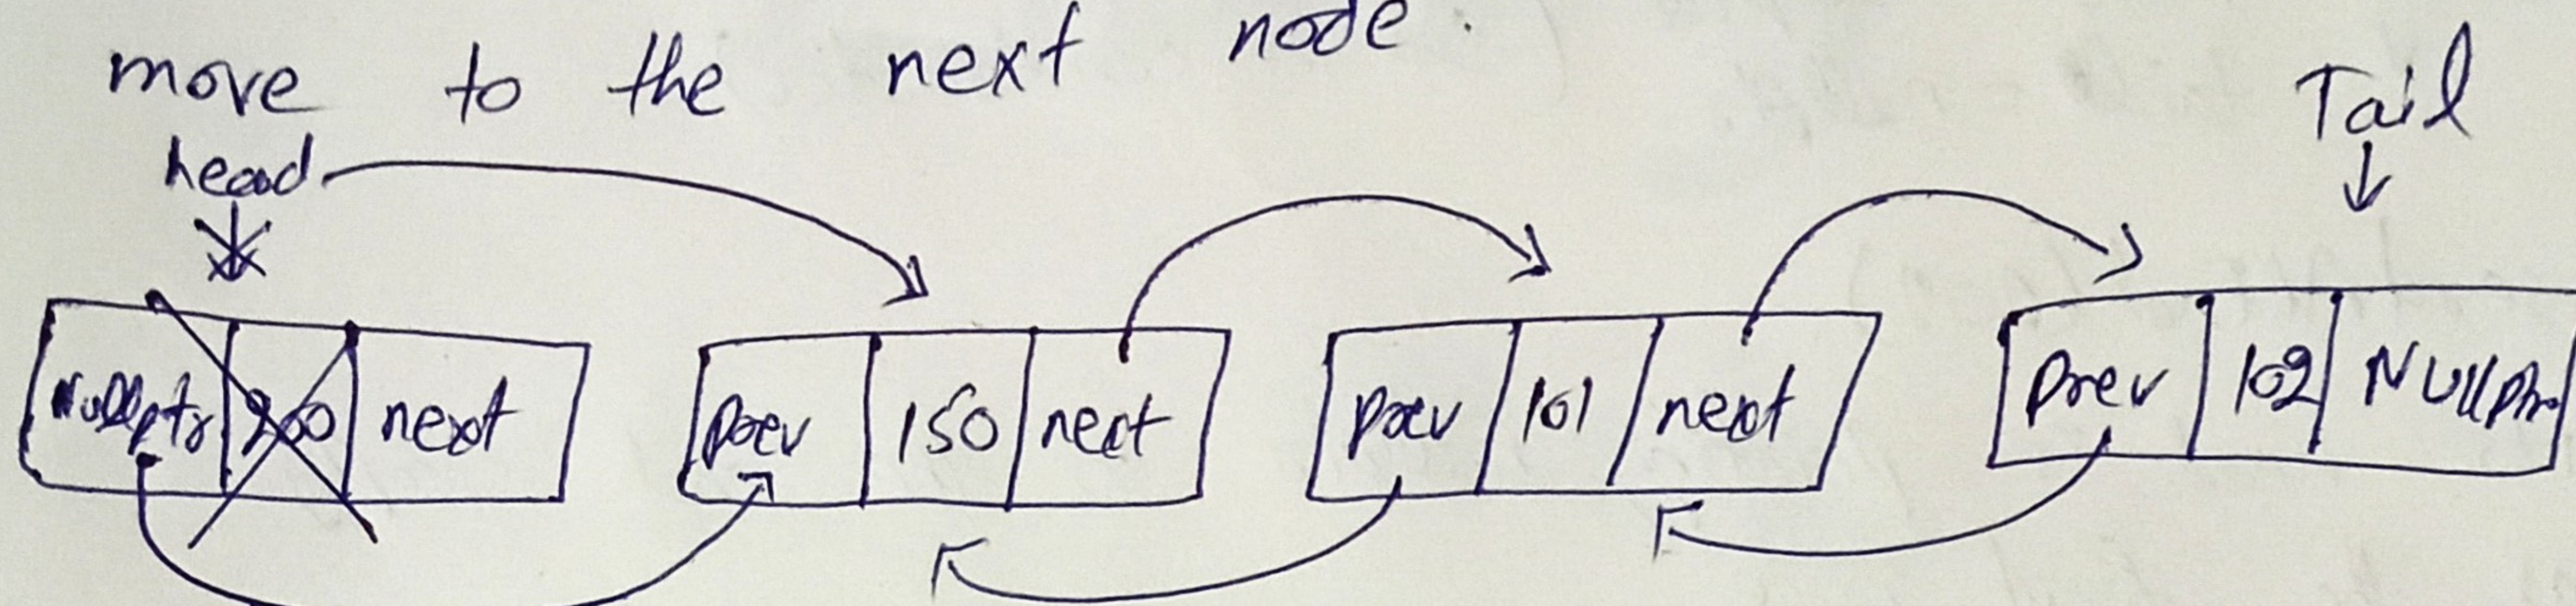

④ insertAtPosition (150, 2).

⑤ deleteFromBeginning()

↳ The first node will be ~~add~~ deleted and head will move to the next node.

- ↳ this address means nullptr will be moved to the next node previous.
- ↳ head will now point the next node
- ↳ first node will be deleted.

⑥ insertAtEnd(300).

↳ Now new node will be added at the End and tail will now start pointing the End node because the new node will be now the end node.

Now Answers:-

- Patient ID at head → 150
- " " " Tail → 300
- From head to tail → 150, 101, 102, 300.
- From Tail to Head → 300, 102, 101, 150..

End
